

1. Take the result of the following line of code (but use whatever available text you want) and write a function to concatenate the data back into sentences, with one readable sentence in each list.  
`sentences = nltk.corpus.gutenberg.sents("carroll-alice.txt")[:10]`
2. Create a function that accepts a list of values. Filter out all values that are non-numeric and return the new list.

Input:

`[1,2,'a','b',7.6]`

output:

`['a','b']`
